

Rocks in the Cabbage Patch?

by Nishaun Smith

This is a counterargument not an argument, meaning this should not be seen as something I believe, this is just an interesting assessment. Is it possible that the fossil record formed spontaneously? When evolutionists preach their theology they claim that the human body was formed slowly after millions of years of evolution. Based on this reasoning seeing that the fossil record is the main *proof* of evolution, can it be said that fossils were formed spontaneously? If a complete human body can be created over a million years then can a fossil spontaneously manifest inside a rock after let's say 2000 years? So based on scientific reasoning, if you believe that a complex body can be created over a long period, then a less complex body (a fossil) could be created over a shorter period of time. Any attempt to disprove this argument could disprove evolution. Can the patterns inside rocks, usually called fossils, spontaneously emerge? Then how could life evolve?
