

Evolution  
by Nishaun Smith

Conceptual evolution is currently a norm in human arrival philosophies but the majority of people on this planet still believe humans were created by a being that exists in a higher state than us and is not affected by time therefore needs no creation story. Evolution in general is questionable because of energy requirements. Most who preach evolution focus their argument on superiority through change; where the most fit survive and also reproduce. The problem is evolution is not gradual change it is gradual energy increase. The laws that govern energy (like the famous every action causes an equal and opposite reaction) whether it be kinetic, inertia or any other kind, all prevent any form of self-regulated energy increase as in a cell splitting in two and having one half or both becoming more complex. Living creatures gain energy by trading energy for food or oxygen; there is no free lunch. Self-regulated energy increase should be seen as impossible. (Self-regulated increase is the same as empowering a creature that is the same size as yourself, so a cell would never be able to empower another cell.)

For a CEE to function it must gain energy from its outside environment. No complex energy environment can take in more energy than the sum of the energy that went into creating it. Energy acquisition is an unseen hurdle to evolution. But energy acquisition is the "most" important aspect to any CEE.
