

Initial Assumptions

by Nishaun Smith

When trying to apperceive any theology it should be understood that all belief systems use initial assumptions. The problem with evolution is it does not start off with a scientific assumption. There is no other science where a complex action or event would be explained by a less complex event. That is to say, no one would ever try to explain a hurricane by saying it evolved from a tornado and we know how hurricanes gather energy. There are mathematical and energy transference reasons to prevent such a thing from happening. When a fossil is found no scientist would ever say that fossil spontaneously evolved from rock or it was simply just a fancy erosion pattern. No scientist would ever assume a fossil was just a fancy rock they would look for a more complex *parent*. There are mathematical reasons that would prevent an object from evolving into a more complex object. For some reason when studying evolution the scientists decided that they would try to explain things in opposition to reality, they determined that they would literally think backwards and preach that less complex entities could manifest more complex entities, they are clearly wrong in doing this.
