

An Approximation of Intellect

by Nishaun Smith

Now that God has been proven, through the human mind, it would be natural to teach those who do not know the God revealing power of logic. Logic is a reaction of intellect, and intellect is a product of all things. Members of the scientific community and other wise men of society may say that evidence is definitive proof. That thinking is quite lax because all evidence needs to be interpreted through logic. The problem with evolution's perspective is logic is built on probability and personal experience, also common sense. A scientist may ask, do you really believe God just poofed us into existence, with a snide look. The mistake of this logic is if logic is governed by probability then it is a fact that more likely than not humans were created by a system of motion more complex than the human brain. We know that this universe follows certain laws, these laws prevent systems of motion from being created by less chaotic systems of motion. The main cause of motion is attraction or repulsion, this means every cell inside the brain had to be attracted or repelled by a specific event. Every cell in the brain had to be set in its specific order by another event. Motion itself cannot evolve, there can be no motion outside of an instigated motion. Therefore the probability is very high that the system of motion that created the human brain was of a higher concentration of complexity.

A rock, a simple stone, itself has vast intellect; intellect is defined as the object's ability to react to any form of influence. Certain rocks react by floating on water while other rocks react by exploding when contact is made with water. The “carbon rock” of the human brain, has a structure that allows it to mimic pattern wise every structure of every stimuli that it contacts, as certain types of birds mimic the human voice. Within this rock contains our hopes and dreams, our art, our testimonies, and the tales we tell. These stories are counted out and multiplied as arguments that define our theology. We believe what we see and nothing else, all stories are a product of truth. There is no new thing under the sun, every quote is a quote.

Knowledge is likened to water, flowing down the mountain of a human brain. As intellect moves it feeds and nourishes the growth. It makes smooth the jagged angles and forks that stand to hinder decision making processes. It washes away the ideas that do not stand up to scientific scrutiny. The brain hates lies, the brain loves God. As the physical body loves its father the mind loves its God. As the mind is born it searches for its father, as the body cries for its mother. Certain things cannot be hidden, certain things cannot be found; God is high on that list. Other than trial and error is there another way to find what you are seeking?

A confused path is a mangled thought that refused to keep what it sought. Truth is not something the brain does naturally. The human brain simply absorbs its surroundings, this means our religions are usually a manifestation of our external associations. The brain is not geared toward information as many would assume: it is more geared to communication and life

experience. This means a person has to actually try to tell the truth. In the human brain words are processed no differently than any other experience, this is why propaganda is such a valuable resource to many. The brain is more interested in the literal usefulness of a phrase than its technical correctness. In layman's terms people believe what they want to, what they feel will help them, what they need to be true.
