## **CEE=complex energy environment**

There are three possible states of reality; death, immortality then evolution; in that order. All CEEs are in a constant state of death, trying to make repairs and maintain systems' actions. The next state would be equilibrium or immortality. A cell gaining enough energy to repair a wound as it is attempting to "form." The last and unattainable state would then be evolution.

A complex energy environment is defined as an area where external resources are slightly separated from internal recourses. This creates an environment that is usually different from the outside of an object. The brain can be seen as a CEE because it would die if it was not separated by the skull and cerebrospinal fluid, cells would die if they were not separated with a cell wall or cell membrane, the sun also classifies as a CEE because it is separated with distance. If the sun was near a black hole then the sun would die "quickly."

There are certain rules that complex energy environments have to live by or follow. CEEs need to maintain themselves because they are separated from the outside world. This maintenance is usually accomplished by different forms of energy acquisition, like eating or osmosis, even so complex energy environments are doomed to death. The particles or energy of all cells, brains, suns, will always dissipate leaving the CEE with

nothing. The forces of nature are continually bombarding the CEEs of nature like a hurricane uprooting and destroying a tree. The surrounding forces of nature also cause CEEs to take their form; when a tree dies it returns to the surrounding liquid and dirt.

Conceptual evolution is currently a norm in human arrival philosophies but the majority of people on this planet still believe humans were created by a being that exists in a higher state than us and is not affected by time therefore needs no creation story. Evolution in general is questionable because of energy requirements. Most who preach evolution focus their argument on superiority through change; where the most fit survive and also reproduce. The problem is evolution is not gradual change it is gradual energy increase. The laws that govern energy (like the famous every action causes an equal and opposite reaction) whether it be kinetic, inertia or any other kind, all prevent any form of self-regulated energy increase as in a cell splitting in two and having one half or both becoming more complex. Living creatures gain energy by trading energy for food or oxygen; there is no free lunch. Self-regulated energy increase can be seen as impossible. (Self-regulated increase is the same as empowering a creature that is the same size as yourself, so a cell would never be able to empower another cell.)

For a CEE to function it must gain energy from it's outside environment. No complex energy environment can take in more energy than the sum of the energy that went into creating it. Energy acquisition is an unseen hurdle to evolution. But energy acquisition is the "most" important aspect to any CEE (like a car attempting to gain fuel).

One of the most dangerous laws to a CEE is the fact that every action causes an equal and opposite reaction. This law alone can single handed-ly destroy evolution. If an object were to hit a wall, the wall would hit back with the same force. If an object hit itself then instead of one impact on the object there would be two. Meaning the object loses twice. If an object commits an action against itself it will be twice weakened, how can an object that is self-evolving change into a stronger object when any self-infliction would cause at least two energy losses? Movement itself takes energy it takes two forces to move in any one direction. This is why helicopters need a tail rotor, if it did not the helicopter would spin in the opposite direction of the main rotor blades.

It takes energy to find energy, also it takes energy to store energy, it takes energy to move food through your circulatory system and also to process it. Life in itself is one constant energy loss, which can produce no evolution, which is why scientists subconsciously have never realized that evolution was energy increase. They usually portray evolution as "lucky change" rarely focusing on the fact that humans stem cells are more powerful than bacteria, meaning that energy would have to be increased on the road from bacteria to stem cell. They would have to declare some sort of evolutionary element but currently scientists claim evolution was caused by "x"-rays or natural (self-regulated) mutation.

For evolution to be true a cell or a small creature has to absorb more energy than it is capable of handling, because larger animals have **more** energy in them than smaller animals. The animal or the cell would be destroyed, osmosis would also stop as the balance of

energy equals with the external environ. The reason for this rule is energy is not necessarily 'energy' it is more a particle, people don't eat light. Even an electron would be a particle with a specific weight and specific rules of engagement. When you pull an electron the electron next to it will attempt to move in the opposite direction this is one of the main causes of electromagnetic reflux which is one of the reason for an explosion after an impact. An object attempting to handle more energy than itself would be vaporized. Therefore, no object can gather more energy than the sum of energies that went into its creation.) It also takes energy to use energy, therefore energy acquisition can only lead to maintenance of an organism, not evolution (or energy increase). Energy, as taken in by an animal, is a particle or food which has to be dealt with. This means you can't simply say that a cell can absorb or eat food and then it would have enough energy to evolve. Eating does not create free energy. Food acquisition is just particle exchange not energy increase. Taking in a large amount of electrons does not give you great power and eating large amounts of food will only make you fat. Therefore energy acquisition can only create weakness, as in; an object eating fire.

There are two ways to energize any CEE. The first would be with pure energy the second would be with complex energy. To understand this think of a city being lite by the sun, this would be pure energy. Then think of a city being lite by street lights, at night, this would be complex energy; it is complex because you need specific points of energy at specific places all happening at the same time.

CEEs need to have energy conversion and

distribution methods such as the human circulatory system or the mitochondria inside living cells. This allows all CEEs to balance themselves and the energy they have acquired. The internal systems of a CEE are governed by the Law of Complexity.

### **Truth Statements**

2) Once you admit that human intelligence can be given a mathematical value and that all objects can absorb and react to stimuli. Then one has to admit that human intelligence had to be created by a force with a higher mathematical intelligence, therefore God has to exist.

4) Cellular reproduction is based on an inertia engine which explains why cells can multiply so easily but this is limited to repetition. So, when a cell tries to change/evolve it can only create a weaker cell, which would make evolution impossible at its core.

9) God has complete control and energizes each movement with time energy. Time is not the forth dimension it is an energy source.

15) Atheists are the hippies of human morality, they claim people can function without God's structured love and morality. They believe in free love and morality; they are doped up on evolution.

19) "Let everyman be fully persuaded in his own mind."
